

CLAIMS

What is claimed is:

- 5 1. A method of multiplexing a plurality of channels in a multimedia system, the method comprises:

receiving a plurality of channels from a multimedia source;

- 10 receiving a plurality of channel selection commands;

selecting a channel of the plurality of channels per channel selection command of the plurality of channel selection commands to produce selected channels; and

15

encoding each of the selected channels based on a data conveyance protocol of the multimedia system to produce a set of encoded channel data.

- 20 2. The method of claim 1, wherein the receiving the channel selection commands further comprises:

receiving, from a plurality of clients, a plurality of channel selection requests; and

processing the plurality of channel selection requests to produce the plurality of channel selection commands, wherein the each of the plurality of channel selection commands includes at least one of: specific channel selection command, last channel selection command, next channel selection command, previous channel selection command, favorite channel selection command, and select channel from user define list.

3. The method of claim 2, wherein the processing the plurality of channel selection requests further comprises at least one of:

interpreting at least one channel selection request to identify at least one client of the plurality of clients and at least one of the channel selection requests of the plurality of channel selection requests;

authenticating a client of the plurality of clients that provides a specific channel selection request; and

authenticating the specific channel selection request.

4. The method of claim 1, wherein the receiving the plurality of channel selection commands further comprises:

monitoring packets on a shared bus;

5

identifying at least one of the packets to contain at least a portion of one of the plurality of channel selection commands; and

10 decoding, based on the data conveyance protocol, the at least one packet to recapture the at least a portion of the one of the plurality of channel selection commands.

5. The method of claim 1, wherein the receiving the

15 plurality of channel selection commands further comprises:

monitoring a shared bus at specific time intervals;

identifying a data frame at one of the specific time

20 intervals that contains at least a portion of one of the plurality of channel selection commands; and

decoding, based on the data conveyance protocol, the data frame to recapture the at least a portion of the one of the plurality of channel selection commands.

5 6. The method of claim 1 further comprises:

receiving a second plurality of channels from a second multimedia source.

10 7. The method of claim 6, wherein the selecting a channel further comprises:

selecting a channel from either the plurality of channels or the second plurality of channels per each of the channel selection commands, wherein each of the channel selection commands includes identity of the multimedia source or the second multimedia source and identity of the channel.

15 8. The method of claim 1, wherein the receiving the plurality of channel selection commands further comprises at least one of:

decrypting each of the plurality of channel selection commands; and

decompressing each of the plurality of channel selection commands.

- 5 9. The method of claim 1, wherein each of the plurality of channels is compressed, wherein the selecting a channel further comprises:

10 selecting a group of compressed channels of the plurality of channels per at least one of the plurality of channel selection commands, wherein the group of compressed channels includes the channel.

- 15 10. The method of claim 9, wherein the encoding further comprises:

encoding the group of compressed channels into packets or frames based on the data conveyance protocol.

- 20 11. The method of claim 1, wherein the encoding further comprises:

packetizing data of each of the selected channels into a packet that includes a header section and a data section,

wherein the header section includes at least one of
identity the selected channel, type of data of the selected
channel, identity of the multimedia source, encryption
enable/disable, type of encryption, compression
5 enable/disable, type of compression, and packet sequence
number.

12. The method of claim 11 further comprises:

10 conveying the packet using at least one of: Carrier Sense
Multiple Access (CSMA), CSMA with collision avoidance, and
CSMA with collision detection.

13. The method of claim 1, wherein the encoding further
15 comprises:

framing data of each of the selected channels into a frame
that includes header section and a data section, wherein
the header section includes at least one of identity the
20 selected channel, type of data of the selected channel,
identity of the multimedia source, encryption
enable/disable, type of encryption, compression
enable/disable, type of compression, and frame number.

14. The method of claim 13 further comprises:

conveying the frame in accordance with at least one of: a
time division multiplexing data conveyance protocol, and
5 frequency division multiplexing data conveyance protocol.

15. The method of claim 1, wherein the encoding further
comprises at least one of:

10 multilevel encoding data of each of the selected channels;

non return to zero (NRZ) encoding the data of each of the
selected channels;

15 Manchester encoding the data of each of the selected
channels;

block encoding the data of each of the selected channels;
and

20

nB/mB encoding the data of each of the selected channels,
where $n < m$.

16. The method of claim 1 further comprises:

data compressing the selected channels prior to encoding.

17. The method of claim 1 further comprises:

5

encrypting the selected channels prior to encoding.

18. The method of claim 1 further comprises:

10 receiving a single channel from a multimedia source;

selecting the single channel based on at least one of the
plurality of channel selection commands to produce a
selected single channel; and

15

encoding the selecting single channel based on the data
conveyance protocol.

19. The method of claim 18, wherein the receiving the

20 single channel further comprises at least one of:

receiving the single channel of audio data and video data
from an output of a video cassette recorder;

receiving the single channel of audio data and video data
from an output of a DVD player;

receiving the single channel of audio data and video data
5 from an output of a camcorder;

receiving the single channel of audio data from an output
of a compact disk player;

10 receiving the single channel of audio data from an output
of a cassette player;

receiving the single channel of at least one of data and
audio data from a telephone connection; and

15 receiving the single channel of at least one of data, audio
data, and video data from a modem.

20. The method of claim 1, wherein the receiving the
20 plurality of channels further comprises at least one of:

receiving audio and video data for each of the plurality of
channels from a satellite connection;

receiving audio and video data for each of the plurality of channels from a set-top box;

receiving audio and video data for each of the plurality of
5 channels from a cable connection;

receiving audio and video data for each of the plurality of channels from a high-definition television receiver; and

10 receiving audio and video data for each of the plurality of channels from an antenna.

21. A method of multiplexing channels in a multimedia system, the method comprises:

receiving a channel from each of a plurality of sources to

5 produce a plurality of channels;

receiving a plurality of channel selection commands;

selecting a channel of the plurality of channels per
10 channel selection command of the plurality of channel
selection command to produce selected channels; and

encoding each of the selected channels based on a data
conveyance protocol of the multimedia system to produce a
15 set of encoded channel data.

22. The method of claim 21, wherein the receiving the
channel selection commands further comprises:

20 receiving, from a plurality of clients, a plurality of
channel selection requests; and

processing the plurality of channel selection requests to
produce the plurality of channel selection commands,

wherein the each of the plurality of channel selection commands includes at least one of: specific channel selection command, last channel selection command, next channel selection command, previous channel selection command, favorite channel selection command, and select channel from user define list.

23. The method of claim 22, wherein the processing the plurality of channel selection requests further comprises at least one of:

interpreting at least one channel selection request to identify at least one client of the plurality of clients and at least one of the channel selection requests of the plurality of channel selection requests;

authenticating a client of the plurality of clients that provides a specific channel selection request; and authenticating the specific channel selection request.

24. The method of claim 21, wherein the receiving the plurality of channel selection commands further comprises:

monitoring packets on a shared bus;

identifying at least one of the packets to contain at least
a portion of one of the plurality of channel selection

5 commands; and

decoding, based on the data conveyance protocol, the at
least one packet to recapture the at least a portion of the
one of the plurality of channel selection commands.

10

25. The method of claim 21, wherein the receiving the
plurality of channel selection commands further comprises:

monitoring a shared bus at specific time intervals;

15

identifying a data frame at one of the specific time
intervals that contains at least a portion of one of the
plurality of channel selection commands; and

20

decoding, based on the data conveyance protocol, the at
least one packet to recapture the at least a portion of the
one of the plurality of channel selection commands.

26?
27?

28. The method of claim 21, wherein the receiving the plurality of channel selection commands further comprises at least one of:

5 decrypting each of the plurality of channel selection commands; and

decompressing each of the plurality of channel selection commands.

10

29. The method of claim 21, wherein the encoding further comprises:

15 packetizing data of each of the selected channels into a packet that includes a header section and a data section, wherein the header section includes at least one of identity the selected channel, type of data of the selected channel, identity of the multimedia source, encryption enable/disable, type of encryption, compression
20 enable/disable, type of compression, and packet sequence number.

30. The method of claim 29 further comprises:

conveying the packet using at least one of: Carrier Sense Multiple Access (CSMA), CSMA with collision avoidance, and CSMA with collision detection.

- 5 31. The method of claim 21, wherein the encoding further comprises:

10 framing data of each of the selected channels into a frame that includes header section and a data section, wherein the header section includes at least one of identity the selected channel, type of data of the selected channel, identity of the multimedia source, encryption enable/disable, type of encryption, compression enable/disable, type of compression, and frame number.

15

32. The method of claim 31 further comprises:

conveying the frame in accordance with at least one of: a time division multiplexing data conveyance protocol, and
20 frequency division multiplexing data conveyance protocol.

33. The method of claim 31, wherein the encoding further comprises at least one of:

multilevel encoding data of each of the selected channels;

non return to zero (NRZ) encoding the data of each of the selected channels;

5

Manchester encoding the data of each of the selected channels;

block encoding the data of each of the selected channels;

10 and

nB/mB encoding the data of each of the selected channels, where $n < m$.

15 34. The method of claim 21 further comprises:

data compressing the selected channels prior to encoding.

35. The method of claim 21 further comprises:

20

encrypting the selected channels prior to encoding.

36. A tuning module for using in multimedia system, the tuning module comprises:

plurality of selectors, wherein each of the plurality of
5 selectors is operably coupled to receive a plurality of
channels, wherein each of the plurality of selectors
outputs a channel of the plurality of channels based on a
respective one of a plurality of channel selection commands
to produce selected channels;

10 encoding module operably coupled to encode the selected
channels based on a data conveyance protocol of the
multimedia system to produce encoded channel data; and

15 bus interface module operably coupled to transmit the
encoded channel data in accordance with the data conveyance
protocol.

37. The tuning module of claim 36, wherein the bus
20 interface module further comprises:

receiving module operably coupled to monitor packets on a
shared bus and to identify at least one of the packets to

contain at least a portion of one of the plurality of channel selection commands to produce an identified packet.

38. The tuning module of claim 37 further comprises:

5

decoding module operably coupled to decode the identified packet, based on the data conveyance protocol, to recapture at least a portion of the one of the plurality of channel selection commands.

10

39. The tuning module of claim 36, wherein the bus interface module further comprises:

15

monitoring module operably coupled to monitor a shared bus at specific time intervals for a data frame that contains at least a portion of one of the plurality of channel selection commands.

40. The tuning module of claim 39 further comprises:

20

decoding module operably coupled to decode, based on the data conveyance protocol, the data frame to recapture the at least a portion of the one of the plurality of channel selection commands.

41. The tuning module of claim 36, wherein the bus interface module further comprises at least one of:

5 decrypting module for decrypting each of the plurality of channel selection commands; and

decompressing module for decompressing each of the plurality of channel selection commands.

10

42. The tuning module of claim 36 further comprises:

second plurality of selectors, wherein each of the second plurality of selectors is operably coupled to receive a

15

second plurality of channels, wherein each of the second plurality of selectors outputs a channel of the second plurality of channels based on a respective one of the plurality of channel selection commands to produce second selected channels.

20

43. The tuning module of claim 36, wherein the encoding module further comprises:

packetizing module for packetizing data of each of the selected channels into a packet that includes a header section and a data section, wherein the header section includes at least one of identity of the selected channel, type of data of the selected channel, identity of a multimedia source, encryption enable/disable, type of encryption, compression enable/disable, type of compression, and packet sequence number.

44. The tuning module of claim 36, wherein the encoding module further comprises:

framing module for framing data of each of the selected channels into a frame that includes header section and a data section, wherein the header section includes at least one of identity the selected channel, type of data of the selected channel, identity of the multimedia source, encryption enable/disable, type of encryption, compression enable/disable, type of compression, and frame number.

20

45. The tuning module of claim 36, wherein the encoding module further comprises at least one of:

multilevel encoding module for multilevel encoding of data of each of the selected channels;

non return to zero (NRZ) encoding module for NRZ encoding
5 of the data of each of the selected channels;

Manchester encoding module for Manchester encoding of the data of each of the selected channels;

10 block encoding module for block encoding of the data of each of the selected channels; and

nB/mB encoding module for nB/mB encoding of the data of each of the selected channels, where $n < m$.

15

46. The tuning module of claim 36 further comprises:

data compressing module operably coupled to the plurality of selectors and the encoding module, wherein the data

20 compressing module receives the selected channels from the plurality of selectors, compresses the selected channels to produce compressed channels, and provides the compressed channels to the encoding module.

47. The tuning module of claim 36 further comprises:

5 encryption module operably coupled to the plurality of
selectors and the encoding module, wherein the encryption
module receives the selected channels from the plurality of
selectors, encrypts the selected channels to produce
encrypted channels, and provides the encrypted channels to
the encoding module.

10 48. The tuning module of claim 36 further comprises:

bus controller operably coupled to the bus interface
module, wherein the bus controller controls receiving of
the plurality of channel selection commands and controls
15 the transmitting of the encoded channel data.

49. An apparatus for multiplexing a plurality of channels in a multimedia system, the apparatus comprises:

processing module; and

5

memory operably coupled to the processing module, wherein the memory includes operational instructions that cause the processing module to:

10

receive a plurality of channels from a multimedia source;

receive a plurality of channel selection commands;

15

select a channel of the plurality of channels per channel selection command of the plurality of channel selection command to produce selected channels; and

20

encode each of the selected channels based on a data conveyance protocol of the multimedia system to produce a set of encoded channel data.

50. The apparatus of claim 49, wherein the memory further comprises operational instructions that cause the

processing module to receive the channel selection commands
by:

receiving, from a plurality of clients, a plurality of
5 channel selection requests; and

processing the plurality of channel selection requests to
produce the plurality of channel selection commands,
wherein the each of the plurality of channel selection
10 commands includes at least one of: specific channel
selection command, last channel selection command, next
channel selection command, previous channel selection
command, favorite channel selection command, and select
channel from user define list.

15

51. The apparatus of claim 50, wherein the memory further
comprises operational instructions that cause the
processing module to process the plurality of channel
selection requests by at least one of:

20

interpreting at least one channel selection request to
identify at least one client of the plurality of clients
and at least one of the channel selection requests of the
plurality of channel selection requests;

authenticating a client of the plurality of clients that provides a specific channel selection request; and

5 authenticating the specific channel selection request.

52. The apparatus of claim 49, wherein the memory further comprises operational instructions that cause the processing module to receive the plurality of channel

10 selection commands by:

monitoring packets on a shared bus;

identifying at least one of the packets to contain at least

15 a portion of one of the plurality of channel selection commands; and

decoding, based on the data conveyance protocol, the at least one packet to recapture the at least a portion of the
20 one of the plurality of channel selection commands.

53. The apparatus of claim 49, wherein the memory further comprises operational instructions that cause the

processing module to receive the plurality of channel selection commands by:

monitoring a shared bus at specific time intervals;

5

identifying a data frame at one of the specific time intervals that contains at least a portion of one of the plurality of channel selection commands; and

10 decoding, based on the data conveyance protocol, the data frame to recapture the at least a portion of the one of the plurality of channel selection commands.

54. The apparatus of claim 49, wherein the memory further
15 comprises operational instructions that cause the processing module to:

receive a second plurality of channels from a second multimedia source.

20

55. The apparatus of claim 54, wherein the memory further comprises operational instructions that cause the processing module to select a channel by:

selecting a channel from either the plurality of channels
or the second plurality of channels per each of the channel
selection commands, wherein each of the channel selection
commands includes identity of the multimedia source or the
5 second multimedia source and identity of the channel.

56. The apparatus of claim 49, wherein the memory further
comprises operational instructions that cause the
processing module to receive the plurality of channel
10 selection commands by at least one of:

decrypting each of the plurality of channel selection
commands; and

15 decompressing each of the plurality of channel selection
commands.

57. The apparatus of claim 49, wherein each of the
plurality of channels is compressed, and wherein the memory
20 further comprises operational instructions that cause the
processing module to select a channel by:

selecting a group of compressed channels of the plurality
of channels per at least one of the plurality of channel

selection commands, wherein the group of compressed channels includes the channel.

58. The apparatus of claim 57, wherein the memory further
5 comprises operational instructions that cause the processing module to encode each of the selected channels by:

10 encoding the group of compressed channels into packets or frames based on the data conveyance protocol.

59. The apparatus of claim 49, wherein the memory further
comprises operational instructions that cause the processing module to encode each of the selected channels
15 by:

packetizing data of each of the selected channels into a packet that includes a header section and a data section, wherein the header section includes at least one of
20 identity the selected channel, type of data of the selected channel, identity of the multimedia source, encryption enable/disable, type of encryption, compression enable/disable, type of compression, and packet sequence number.

60. The apparatus of claim 59, wherein the memory further comprises operational instructions that cause the processing module to:

5

convey the packet using at least one of: Carrier Sense Multiple Access (CSMA), CSMA with collision avoidance, and CSMA with collision detection.

10

61. The apparatus of claim 49, wherein the memory further comprises operational instructions that cause the processing module to encode each of the selected channels by:

15

framing data of each of the selected channels into a frame that includes header section and a data section, wherein the header section includes at least one of identity the selected channel, type of data of the selected channel, identity of the multimedia source, encryption

20

enable/disable, type of encryption, compression enable/disable, type of compression, and frame number.

62. The apparatus of claim 61, wherein the memory further comprises operational instructions that cause the processing module to:

- 5 convey the frame in accordance with at least one of: a time division multiplexing data conveyance protocol, and frequency division multiplexing data conveyance protocol.

63. The apparatus of claim 49, wherein the memory further
10 comprises operational instructions that cause the processing module to encode each of the selected channels by at least one of:

multilevel encoding data of each of the selected channels;

15 non return to zero (NRZ) encoding the data of each of the selected channels;

Manchester encoding the data of each of the selected
20 channels;

block encoding the data of each of the selected channels;
and

nB/mB encoding the data of each of the selected channels,
where $n < m$.

64. The apparatus of claim 49, wherein the memory further
5 comprises operational instructions that cause the
processing module to:

compress the selected channels prior to encoding.

10 65. The apparatus of claim 49, wherein the memory further
comprises operational instructions that cause the
processing module to:

encrypt the selected channels prior to encoding.

15 66. The apparatus of claim 49, wherein the memory further
comprises operational instructions that cause the
processing module to:

20 receive a single channel from a multimedia source;

select the single channel based on at least one of the
plurality of channel selection commands to produce a
selected single channel; and

encode the selecting single channel based on the data conveyance protocol.

67. An apparatus for multiplexing channels in a multimedia system, the apparatus comprises:

processing module; and

5

memory operably coupled to the processing module, wherein the memory includes operational instructions that cause the processing module to:

10

receiving a channel from each of a plurality of sources to produce a plurality of channels;

receiving a plurality of channel selection commands;

15

selecting a channel of the plurality of channels per channel selection command of the plurality of channel selection command to produce selected channels; and

20

encoding each of the selected channels based on a data conveyance protocol of the multimedia system to produce a set of encoded channel data.

68. The apparatus of claim 67, wherein the memory further comprises operational instructions that cause the

processing module to receive the channel selection commands
by:

receiving, from a plurality of clients, a plurality of
5 channel selection requests; and

processing the plurality of channel selection requests to
produce the plurality of channel selection commands,
wherein the each of the plurality of channel selection
10 commands includes at least one of: specific channel
selection command, last channel selection command, next
channel selection command, previous channel selection
command, favorite channel selection command, and select
channel from user define list.

15

69. The apparatus of claim 67, wherein the memory further
comprises operational instructions that cause the
processing module to process the plurality of channel
selection requests by at least one of:

20

interpreting at least one channel selection request to
identify at least one client of the plurality of clients
and at least one of the channel selection requests of the
plurality of channel selection requests;

authenticating a client of the plurality of clients that provides a specific channel selection request; and

5 authenticating the specific channel selection request.

70. The apparatus of claim 67, wherein the memory further comprises operational instructions that cause the processing module to receive the plurality of channel
10 selection commands by:

monitoring packets on a shared bus;

identifying at least one of the packets to contain at least
15 a portion of one of the plurality of channel selection commands; and

decoding, based on the data conveyance protocol, the at least one packet to recapture the at least a portion of the
20 one of the plurality of channel selection commands.

71. The apparatus of claim 67, wherein the memory further comprises operational instructions that cause the

processing module to receive the plurality of channel selection commands by:

monitoring a shared bus at specific time intervals;

5

identifying a data frame at one of the specific time intervals that contains at least a portion of one of the plurality of channel selection commands; and

10 decoding, based on the data conveyance protocol, the at least one packet to recapture the at least a portion of the one of the plurality of channel selection commands.

72. The apparatus of claim 67, wherein the memory further
15 comprises operational instructions that cause the processing module to receive the plurality of channel selection commands by at least one of:

decrypting each of the plurality of channel selection
20 commands; and

decompressing each of the plurality of channel selection commands.

73. The apparatus of claim 67, wherein the memory further comprises operational instructions that cause the processing module to encode each of the selected channels by:

5

packetizing data of each of the selected channels into a packet that includes a header section and a data section, wherein the header section includes at least one of identity the selected channel, type of data of the selected
10 channel, identity of the multimedia source, encryption enable/disable, type of encryption, compression enable/disable, type of compression, and packet sequence number.

15 74. The apparatus of claim 73, wherein the memory further comprises operational instructions that cause the processing module to:

convey the packet using at least one of: Carrier Sense
20 Multiple Access (CSMA), CSMA with collision avoidance, and CSMA with collision detection.

75. The apparatus of claim 67, wherein the memory further comprises operational instructions that cause the

processing module to encoding each of the selected channels
by:

framing data of each of the selected channels into a frame
5 that includes header section and a data section, wherein
the header section includes at least one of identity the
selected channel, type of data of the selected channel,
identity of the multimedia source, encryption
enable/disable, type of encryption, compression
10 enable/disable, type of compression, and frame number.

76. The apparatus of claim 75, wherein the memory further
comprises operational instructions that cause the
processing module to:

15 convey the frame in accordance with at least one of: a
time division multiplexing data conveyance protocol, and
frequency division multiplexing data conveyance protocol.

20 77. The apparatus of claim 67, wherein the memory further
comprises operational instructions that cause the
processing module to encode each of the selected channels
by at least one of:

multilevel encoding data of each of the selected channels;

non return to zero (NRZ) encoding the data of each of the selected channels;

5

Manchester encoding the data of each of the selected channels;

block encoding the data of each of the selected channels;

10

and

nB/mB encoding the data of each of the selected channels,
where $n < m$.

15

78. The apparatus of claim 67, wherein the memory further comprises operational instructions that cause the processing module to:

compress the selected channels prior to encoding.

20

79. The apparatus of claim 67, wherein the memory further comprises operational instructions that cause the processing module to:

encrypt the selected channels prior to encoding.

1. The first step is to select the channels to be encrypted. This is done by the user or a program. The selected channels are then encrypted using a key. The key is a secret value that is used to encrypt and decrypt the data. The key is shared between the sender and the receiver. The key is used to encrypt the data by multiplying the data by the key. The result is the encrypted data. The encrypted data is then sent to the receiver. The receiver uses the key to decrypt the data by dividing the encrypted data by the key. The result is the original data.
